

CSS Resume Design Assignment

You have been given the HTML and CSS for a fake resume for Homer Simpson. The HTML already includes the content, structure, image, alt text and caption.

Your job is to improve the design by editing the CSS file.

Do not rewrite the resume. Do not delete whole sections. Focus on fixing the design problems.

Required changes:

1. Fix the contrast.

The current background color and text color are difficult to read. Change the colors so the page is readable.

2. Fix the alignment.

The resume sections do not line up cleanly. Adjust the margins so the content starts in a consistent place.

3. Fix the page width.

The resume should not stretch awkwardly across the page. Set a reasonable width or max-width and center the resume.

4. Fix the typography hierarchy.

Right now, the name, section headings, job titles and body text are all the same size and weight. Make the most important information stand out.

5. Fix the fonts.

The page uses too many different fonts. Choose one or two fonts and apply them consistently.

6. Fix the section heading styles.

Each section heading currently has a different color. Create one consistent style for all section headings.

7. Fix the spacing.

Some sections are too close together and others are too far apart. Adjust margin and padding so related information is grouped together.

8. Fix the image.

The image is too large and poorly aligned. Resize it and align it so it fits neatly with the resume.

9. Fix the caption.

The caption spacing is awkward. Style the caption so it clearly belongs with the image.

Optional bonus:

Add one design detail, such as a border, background color, divider line or accent color, that improves the resume without making it feel cluttered.
